Full Stack Engineer

Full stack engineer and technical partner, building since 2022, and a **Computer Science student at BINUS University**. I take products **from the first plan to production** — architecture, data model, backend, web and Android, and the decisions in between — with **7 products shipped**. As **tech lead on FundChain** I turned 27 conflicting planning docs into one spec and led a **team of 15 across four workstreams**. Primary stack: **TypeScript, React, Next.js, NestJS, and PostgreSQL**. Open to **full time work for one year, starting 2027**.

Technical Skills

Languages	:	TypeScript, JavaScript, Kotlin, Solidity, PHP, SQL, HTML, CSS
Frontend	:	React, Next.js, Vite, Tailwind CSS, Zustand, Three.js
Mobile	:	Kotlin, Jetpack Compose, Media3, ExoPlayer, React Native (Expo)
Backend	:	Node.js, NestJS, Laravel, Server Actions, Prisma, Drizzle ORM, REST APIs
Databases	:	PostgreSQL, Supabase, Firebase, Firestore, Room
Blockchain	:	Solidity, Hardhat, OpenZeppelin, ethers v6, EIP-712, IPFS, Ethereum Sepolia
Practices	:	System design, data modelling, auth, RLS, offline first sync, payments, sprint planning, code review
Dev Tools	:	Git, GitHub, Jira, Vercel, Turborepo, pnpm, Vitest

Experience

Tech Lead 2026
FundChain — BINUS fundraising platform (team of 15) *fundchain-web.vercel.app*

- **Led a team of 15** across four workstreams (backend, blockchain, frontend, QA) on a platform where every paid donation is hashed onto Ethereum Sepolia; split **105 Jira issues** over five epics and six sprints, each workstream with its own owner
- Read **27 planning docs** and resolved **19 conflicts** between them — hash format, relayer role, webhook idempotency — before any code was written
- Built the foundation myself: **NestJS API, React web, a Hardhat contract, and Supabase in one monorepo**, live on Vercel and Sepolia by day two
- Linked GitHub to Jira with key based branch and PR rules, **reviewed and merged the team's pull requests**, and kept the demo path working end to end: pay, hash, notarize, tamper, freeze

Full Stack Engineer Jul 2026 – Sep 2026
CreativIn (Contract) *Hybrid — Indonesia*

- Built and shipped client facing web features end to end with **TypeScript, React, and Node.js**, owning schema, API, and interface in the same pass
- Worked directly with the team on **architecture and data modelling** decisions, keeping the reversible ones cheap to change

Full Stack Software Engineer Dec 2022 – Present
Self Employed (Freelance) *Remote — Jakarta, Indonesia*

- Develop web applications with **Laravel**, and design the **backend system structure and application logic** behind them
- Deliver products **from zero to production** — schema, API, interface, deployment, and the monitoring after — so nothing is lost in the handover between front end and back end
- Act as a **long term technical partner** for founders: involved from early planning through launch and the improvements after, including saying what should not be built and what a shortcut will cost later

IT Support Specialist Sep 2024 – Sep 2025
Alchemist Law Office (Part-time) *On-site — Jakarta, Indonesia*

- Provided **technical support** for staff hardware, software, and network issues, keeping day to day legal work running without interruption
- Maintained internal systems and **Microsoft Excel** based workflows used across the office

Web Designer Dec 2022 – Mar 2023
UTERO INDONESIA (Internship) *On-site — Malang, East Java, Indonesia*

- Designed and built **responsive web pages**, translating brand and layout requirements into working interfaces

Education

BINUS University Jakarta, Indonesia
Bachelor of Computer Science *Aug 2024 – Sep 2028 (expected)*

SMK Telekomunikasi Darul Ulum Jombang, East Java, Indonesia
Software Engineering (Rekayasa Perangkat Lunak) *Aug 2021 – Jun 2024*

Projects

PassingLab — paid UTBK tryout platform Mar 2026 – Present
Next.js 16, React 19, TypeScript, Supabase Postgres, Drizzle ORM, Tailwind v4 passinglab.id

- **Sole full stack engineer** on a full rewrite of a live Laravel and Blade product onto **Next.js 16 App Router, React 19 Server Actions, and Drizzle**, migrating the old MySQL data with a script that runs dry under `--check` first; now **24 tables, 177 TypeScript files, and roughly 24,000 lines** serving 1,604 questions across 7 UTBK subtests
- Built the exam engine so **an answer cannot be lost**: idempotent autosave upserts that keep working while the tab is hidden, a **server computed timer** that never trusts the browser clock, and deterministic seed based shuffling so a reload restores the exact same question order
- Closed an **account takeover path** inherited from the old app — OTPs are now scoped by purpose, single use, constant time compared, and capped at five attempts; added bcrypt at 12 rounds, **database backed rate limiting** that holds across instances, and moved an admin role check copied into some 40 controller methods (one of them missing it) onto the admin layout
- Made **QRIS payments** safe to repeat: the public webhook is treated only as a nudge to re verify with the provider against my own stored amount, entitlements are granted by one function shared with the admin button, and invoice PDF, email, and Telegram all run after the response so an approval never waits on a mail server
- Kept scoring, pricing, and shuffling in **pure modules with no database imports**, covered by unit tests on exactly the paths where a mistake costs the most

HakaiKOL — influencer marketplace 2026 – Present
React, Vite, NestJS, Prisma, PostgreSQL, Supabase, Tailwind hakaikol.vercel.app

- **Full stack engineer and technical partner** on a two sided KOL marketplace where brands pick creators by numbers they can check, running a campaign end to end in one record: creator discovery, brief, content drafts, proof of posting, invoice, and a printable performance report
- Creators connect Instagram and TikTok through **OAuth**, so follower counts and engagement rates come straight from the platforms instead of self reported rate cards
- Hardened the data layer: the public Supabase key shipped in every browser bundle holds **only auth and storage rights and zero table access**, with all data going through NestJS as a BYPASSRLS role and **RLS still enabled on every table** as a second layer

HakaiTask — Indonesian chat task manager, no AI Aug 2026
React, Vite, TypeScript, Zustand, Supabase, Tailwind v4, Turborepo hakaitask.my.id

- **Full stack engineer in a team of two** on a task manager you talk to in Indonesian: a readable dictionary turns one sentence like *"lusa jam 3an"* into a dated task, and it **asks instead of guessing** when a sentence is unclear
- **Offline first**: every write lands on the device first, and conflicts merge per field
- Kept the chat engine in **pure TypeScript with no React or network**, tested on its own, plus a personal dictionary that remembers words a user teaches it once

HakaiMusic — native Android music client 2026 – Present
Kotlin, Jetpack Compose, Media3, ExoPlayer, Room, WorkManager, Firestore Source

- Built a **dual engine player** behind a single media session: ExoPlayer is tried first, and when no usable stream URL resolves, playback swaps to a headless WebView engine implemented as a Media3 player — so lock screen, notification, and Bluetooth controls keep working across the swap
- Made the **device the source of truth**: library, queue, history, and downloads live in **Room** and never need a network round trip; signing in is optional and only adds sync
- Wrote sync that **assumes the connection will drop** — timestamps are stamped only after the Firestore batch commits, so an unsent row is visibly unsynced rather than silently lost, and client generated ids make a repeated sync produce no duplicates

KaiCash — personal finance app Jun 2026
React Native, Expo, Firebase, TypeScript *Source*

- **Sole designer and developer** of an Android money tracker with budgets, savings goals, and a receipt photo on every record
- Built an **account pairing system** that lets a parent supervise spending in real time without anyone borrowing a phone or a login, using **Firebase** for two sided sync instead of a custom socket layer

Collatera — on-chain promissory notes (hackathon) Oct 2026
Next.js, Prisma, Solidity, Hardhat, ethers v6, Ethereum Sepolia *collatera-app.vercel.app*

- **Full stack engineer in a team of five**: a promissory note both sides sign with **gasless EIP-712 signatures** through a relayer, with a non-transferable **ERC-721** token as the creditor's right to collect
- Stablecoin installments with automatic overdue status, and an **integrity check that freezes a note** if the database and the chain disagree

Freelance Escrow — milestone escrow contract Sep 2026 – Oct 2026
Solidity 0.8.28, Hardhat 3, OpenZeppelin, React, Vite, ethers v6, IPFS *flescrow.vercel.app*

- **Full stack engineer in a team of five** (BINUS Prototyping Blockchain course): freelance payments released per milestone, with **no withdraw, receive, or fallback function** so a client cannot pull funds back
- Anyone can trigger **auto release** once the review period passes, so a silent client cannot hold money hostage; proof of work sits on **IPFS with only its CID on-chain** to save gas, and disputes go to an arbitrator
